Paweł Hrycaj, M.D., Ph.D.

Approach to a patient with monoarthritis/oligoarthritis

Department of Rheumatology and Clinical Immunology
University School of Medical Sciences, Poznań
Classification of arthritis according to the number of joints involved

- Polyarthritis
- Monoarthritis
- Oligoarthritis
A-K, a 40-year old male patient came to his family doctor because of severe pain and swelling in his left knee. There was no history of any trauma to the joint. On physical examination swelling of the joint and effusion was present …
Which conditions should be taken into account?
Most common causes of acute monoarthritis

- Crystal-induced arthritis
- Infection
- Traumatic lesions
Potential causes of acute monoarthritis

- Crystal-induced
- Infectious arthritis
  - Bacteria/Fungi
  - Mycobacteria/Viruses
  - Lyme disease
- Overuse Trauma
- Osteoarthritis
- Hemarthrosis
- Internal derangement
- Osteomyelitis
- Avascular necrosis of bone

- Bone malignancies
- Bowel-disease-associated arthritis
- Hemoglobinopathies
- Juvenile arthritis
- Loose body
- Psoriatic arthritis
- Rheumatoid arthritis
- Reactive arthritis
- Sarcoidosis

- Amyloidosis
- Behçet's syndrome
- Familial Mediterranean fever
- Foreign-body synovitis
- Hypertrophic pulmonary osteoarthropathy
- Intermittent hydrarthrosis
- Pigmented villonodular synovitis
- Relapsing polychondritis
- Still's disease
- Synovioma
- Synovial metastasis
- Vasculitic syndromes
Diagnostic Clues in Patients Presenting with Joint Pain (1)

- Sudden onset of pain in seconds or minutes
- Onset of pain over several hours or one to two days
- Insidious onset of pain over days to weeks
- Intravenous drug use, immunosuppression
- Previous acute attacks in any joint, with spontaneous resolution

Fracture, internal derangement trauma, loose body
Infection, crystal deposition disease, other inflammatory arthritic condition
Indolent infection, osteoarthritis, infiltrative disease, tumor
Septic arthritis
Infection, crystal deposition disease, other inflammatory arthritic condition
Diagnostic Clues in Patients Presenting with Joint Pain (2)

- Recent prolonged course of corticosteroid therapy → Infection, avascular necrosis
- Coagulopathy, use of anticoagulants → Hemarthrosis
- Urethritis, conjunctivitis, diarrhea, and rash → Reactive arthritis
- Psoriatic patches or nail changes such as pitting → Psoriatic arthritis
- Use of diuretics, presence of tophi, history of renal stones or alcoholic binges → Gout
Diagnostic Clues in Patients Presenting with Joint Pain (3)

- Eye inflammation, low back pain  ➔  Ankylosing spondylitis

- Young adulthood, migratory polyarthralgias, inflammation of the tendon sheaths of hands and feet, dermatitis  ➔  Gonococcal arthritis

- Hilar adenopathy, erythema nodosum  ➔  Sarcoidosis
What to do next?
Until infection has been ruled out, corticosteroids should not be injected into a joint!
If not contraindicated, i.a. glucocorticoid injection is recommended in many patients with monoarthritis
Diagnosing Acute Monoarthritis

Complete history and physical examination → Rule out soft tissue problems around the joint.

History of trauma or focal bone pain

→ Plain-film radiographs → Osteoarthritis, chondrocalcinosis → Obtain CBC, ESR, and uric acid level.

Fracture, avulsions

→ Joint effusion or inflammation

→ Arthrocentesis

→ No effusion but severe symptoms

Consider referral: patient may need CT or MRI for diagnosis or US to guide aspiration.

Crystals

SF WBC count < 2,000 per mm³ (2 × 10⁹ per L)

Crystalline arthritis (infection cannot be excluded automatically)

Treatment

SF WBC count > 2,000 per mm³

Noninflammatory condition (osteoarthritis or internal derangement)

SF WBC count > 100,000 per mm³ (100 × 10⁹ per L)

Inflammatory arthritis

Septic arthritis until proved otherwise

Antibiotics, urgent consultation

SF bloody

Large fat droplets

Occult fracture, internal derangement, tumor

Fractures

*On occasion, however, high WBC counts can occur in patients with other conditions, such as gout or rheumatoid arthritis.
### Categorization of Synovial Fluid, with Associated Conditions

<table>
<thead>
<tr>
<th>Noninflammatory: $&lt; 2,000$ WBC per mm$^3$ (2 × 10$^9$ per L)</th>
<th>Inflammatory: $&gt; 2,000$ WBC per mm$^3$</th>
</tr>
</thead>
<tbody>
<tr>
<td>Osteoarthritis</td>
<td>Septic arthritis*</td>
</tr>
<tr>
<td>Trauma</td>
<td>Crystal-induced monoarthritis (e.g., gout, pseudogout)</td>
</tr>
<tr>
<td>Avascular necrosis</td>
<td>Rheumatoid arthritis</td>
</tr>
<tr>
<td>Charcot’s arthropathy</td>
<td>Spondyloarthropathy</td>
</tr>
<tr>
<td>Hemochromatosis</td>
<td>Systemic lupus erythematosus</td>
</tr>
<tr>
<td>Pigmented villonodular synovitis</td>
<td>Juvenile rheumatoid arthritis, Lyme disease, other crystalline arthritides</td>
</tr>
</tbody>
</table>

WBC = white blood cell.

*—Synovial fluid analysis in patients with septic arthritis often shows more than 90 percent polymorphonuclear neutrophilic leukocytes.
### Common Errors in Diagnosing Acute Monoarthritis

<table>
<thead>
<tr>
<th>Error</th>
<th>Reality</th>
</tr>
</thead>
<tbody>
<tr>
<td>The problem is in the joint, because the patient complains of “joint pain.”</td>
<td>The soft tissues around the joint can be the source of the pain (e.g., olecranon bursitis of the elbow, prepatellar bursitis of the knee).</td>
</tr>
<tr>
<td>Crystal-proven diagnosis of gout or pseudogout rules out infection.</td>
<td>Crystals can be present in a septic joint.</td>
</tr>
<tr>
<td>The presence of fever is useful in distinguishing infectious causes from other causes.</td>
<td>Fever may be absent in patients with infectious monoarthritis but can be a presenting feature in acute attacks of gout or pseudogout. Fever may occur for other reasons in certain patients (e.g., the immunocompromised).</td>
</tr>
<tr>
<td>A normal serum uric acid level makes gout a less likely diagnosis.</td>
<td>Serum uric acid levels often are lowered in patients with acute gout. Conversely, there may be unrelated hyperuricemia in patients with other conditions.</td>
</tr>
<tr>
<td>Gram staining and culture of synovial fluid are sufficient to exclude infection.</td>
<td>Cultures of blood, urine, or another primary site of infection (e.g., abscess) must be obtained and repeated as necessary if infection is strongly suspected clinically. Culture results may be negative in early infection.</td>
</tr>
</tbody>
</table>
## Indications for Referral

<table>
<thead>
<tr>
<th>Circumstance</th>
<th>Reasons for referral</th>
</tr>
</thead>
<tbody>
<tr>
<td>Failed arthrocentesis or joints that are difficult to aspirate, such as hips</td>
<td>Need for computed tomography or ultrasound-guided arthrocentesis</td>
</tr>
<tr>
<td>and sacroiliac joints</td>
<td></td>
</tr>
<tr>
<td>Septic arthritis</td>
<td>Urgent consultation, hospitalization for intravenous antibiotics, joint drainage, débridement; infectious disease</td>
</tr>
<tr>
<td></td>
<td>consultation for atypical infections</td>
</tr>
<tr>
<td>Suspected inflammatory polyarthritis or recurrent monoarthritis unresponsive</td>
<td>Rheumatologist evaluation and management</td>
</tr>
<tr>
<td>to treatment</td>
<td></td>
</tr>
<tr>
<td>Undiagnosed chronic monoarthritis</td>
<td>Need for closed synovial biopsy or arthroscopy</td>
</tr>
</tbody>
</table>
Common causes of oligoarthritis

- Reactive arthritis
- Psoriatic arthritis
- Ankylosing spondylitis
- Early rheumatoid arthritis
- Gonococcal arthritis
- Rheumatic fever
- Lyme disease
How to treat monoarthritis?
